

1

Ladder Cord Mechanism

Place the blind in fitting position and tilt forward so that you can see inside the headrail. The brackets must be positioned at least 5cm away from the ladder cord mechanisms.

2a

Face-Fix

For fitting the blind to a wall or window frame, the bracket sits directly behind the blind.

Position the bracket so that the white plastic clip is facing directly towards you. Mark the position of the holes and fix the bracket into place using the screws provided.

NB: Rawl-plugs will be required if you are fitting the brackets directly to the wall.

2b

Top-Fix

For fitting the blind to the upper section of a recess or to the ceiling, the brackets sits directly above the blind.

Measure the distance that any handles protrude from the window frame (A), use this to mark the lintel and use the mark to position the rear of the bracket. Mark the position of the holes and fix the bracket to the lintel with the screws provided.

NB: Rawl-plugs will be required if you are fitting the brackets to a concrete or plaster lintel.

3

Hook the rear edge of the head rail onto the bracket so that the inner lip of the rail sits upon the metal hook of the bracket.

4

Finally, push the head rail upwards to engage the white plastic hook on the bracket. There will be an audible 'click' as the rail slots onto the bracket. Repeat this on each bracket to finish.

5

Child Safety Device Installation

Cord safety cleat

Our blinds are provided as standard with a compliant child-safety device (cord safety-cleat), which must be installed.

This is designed to ensure that the operating cords cannot form a loop equal to or greater than 220mm at less than 1600mm from floor level, safely preventing any risk of accidental strangulation.

The safety cleat shall be installed as close to the headrail as possible and **in all cases not less than 1600mm from the floor**, because a child is capable of unwinding a cord from a cleat.

The cord must be fully accumulated around the safety cleat(s) when the blind is not in use. Use the table below to determine the distance required between the cleats to fully accumulate the cords when the blind is fully raised.

Drop of Blind	*Distance between cord cleats (centre to centre)
1-1000mm	100mm
1001-2000mm	150mm
2001-3000mm	300mm

Place the safety cleat in the desired position on the wall and mark the positions of the holes with a pencil.

Mark the hole positions and drill as required. Use the screws provided to attach the safety cleat to the wall.

Wrap the cords around the cord cleats in a figure of 8. When the cords are fully accumulated ensure they are secure so when any cord is pulled no excess cord is released.

Hold-Down Clips

As a requirement for child safety, our Venetians have to be fitted with hold down clips. Place the clips at the bottom of the window area so that they line up with the bottom of the blind when it is in the 'down' position. Screw the clip to the window sill or the wall (the side of the recess) with a single screw and a wall plug if installing into plaster.

Fitting to Sill Fitting to Wall

'Click' the pegs on the bottom bar into the cups on the clips to secure the blind.
